Abstract

The occupation of Brazilian territory has always been accomplished without planning, causing great damage to the environment. This study intends to compare the economical losses with the adaptation to the environmental legislation (Brazilian Law 4.771, of 15/09/1965), of economic activities performed in the municipal district of Missal (PR), in the period of 2005-2007, with the earnings of the environmental improvement and the "sale" of CO2 quotas. After visits to the studied area, use of GPS and economical calculations and adaptation, it could be concluded that the environmental and economical earnings are larger than the costs associated to the environmental handling.

Keywords: *Environmental legislation; Economic production; Missal.*
