### **Abstract**

The Logistics have been essential to reduce costs in service operations, as important as productive operations. Tools to prevent the production processes' impacts such as P+L<sup>1</sup>, were not enough for requirements related to external logistic. Industries are rethinking their processes but they are affected by negative images caused by carbon emissions from trucks used to transport their products, for example. Sustainable Logistics concept is an inviting to new sectors to discuss solutions for sustainable development.

*Keywords: social responsibility, logistics, sustainability, transport system.*
